

SAP Supply Chain Digitalization with Neptune

All systems | Any device | Offline | SAP specialized

Successfully introduce digital solutions for your Supply Chain

Find out why so many companies choose to use the Neptune DX Platform (Neptune DXP) for the digitalization of their Supply Chain. Let these top 5 reasons speak for us:

1 Flexible start into your digital SAP application project

Various implementation approaches can be pursued with Neptune. You are able to easily develop applications yourself or get the help of one of our partners, use our template apps or choose an “Out of the Box” solution for your supply chain digitization needs. We provide you with a toolbox that lets you choose how to create, build or develop digital solutions (whether it is a no-code, low-code, or pro-code approach). IT & business can build how they see fit in an easy and scalable way. Specific to your requirements, the available skill sets and timeline, we deliver the ideal mix between in-house development, template apps and finished solutions.

2 Develop only once with free choice for systems & end devices (iOS, Android, Windows - mobile, desktop or offline)

The hybrid approach of Neptune enables the choice of your end devices. Applications only need to be developed once and can then be deployed anywhere for iOS, Windows and Android. Native device functions such as barcode scanners and cameras can be easily integrated into the applications. A unified UX across any device and operating system makes apps end-user friendly and provides fast and easy user acceptance.

3 Lean architecture and stable performance of your SAP Fiori Apps

Neptune DXP is embedded directly within your existing SAP system. It is not necessary to set up additional infrastructure, such as middleware for data synchronization. This means that applications can be piloted with little effort and in a short time. By using SAP Fiori and SAP certification for SAP ERP, S/4 HANA & BTP, we guarantee full conformity to your company’s IT roadmap. Making your business processes up to 10x faster.

4 Close the functional gap between SAP WM/EWM and mobile usage

When it comes to optimizing WM and EWM through mobile apps, SAP users face some challenges. With our modern software development tools and comprehensive API design and management, you are easily prepared for the future setup of your IT architecture.

5 Flexibility for user groups and usage scenarios

Contrary to a “single app” that maps the entire supply chain, Neptune provides a launchpad/cockpit. Lean apps for sub-processes call each other and transfer data. In addition, individual apps can be made available to other user groups. Any app can easily be extracted and reused for other scenarios. Gaining 365-degree views into your supply chain!
